#### FIELD OF THE INVENTION

#### **BACKGROUND OF THE INVENTION**

The first reliable report on the 1H-imidazo[4,5-c]quinoline ring system, Backman et al., *J. Org. Chem.*, 15, 1278-1284 (1950) describes the synthesis of 1-(6-methoxy-8-quinolinyl)-2-methyl-1H-imidazo[4,5-c]quinoline for possible use as an antimalarial agent. Subsequently, syntheses of various substituted 1H-imidazo[4,5-c] quinolines were reported. For example, Jain et al., *J. Med. Chem.*, 11, 87-92 (1968), synthesized the compound 1-[2-(4-piperidyl)ethyl]-1H-imidazo[4,5-c]quinoline as a possible anticonvulsant and cardiovascular agent. Also, Baranov et al., *Chem. Abs.*, 85, 94362 (1976), have reported several 2-oxoimidazo[4,5-c]quinolines, and Berenyi et al., *J. Heterocyclic Chem.*, 18, 1537-1540 (1981), have reported certain 2-oxoimidazo[4,5-c]quinolines.

Certain 1H-imidazo[4,5-c]quinolin-4-amines and 1- and 2-substituted derivatives thereof were later found to be useful as antiviral agents, bronchodilators and immunomodulators. These are described in, inter alia, U.S.

There continues to be interest in the imidazoquinoline ring system and there is a continuing need for compounds that have the ability to modulate the immune response, by induction of cytokine biosynthesis or other mechanisms.

#### **SUMMARY**

The present invention provides a new class of compounds that are useful in inducing cytokine biosynthesis in animals. Such compounds are of the following Formula (I):

and more specifically of the following Formula (II):

5

10

$$(R)_{n} + R_{2}$$

$$R_{3} + R_{1}$$

$$R_{1}$$

wherein: R, n, R', R'',  $R_1$ ,  $R_2$ , and  $R_3$  are as defined below.

The compounds of Formulas I and II are useful as immune response modifiers (IRMs) due to their ability to modulate cytokine biosynthesis (e.g., induce or inhibit the biosynthesis or production of one or more cytokines) and otherwise modulate the immune response when administered to animals.

25 Compounds can be tested per the test procedures described in the Examples

Section. Compounds can be tested for induction of cytokine biosynthesis by incubating human PBMC in a culture with the compound(s) at a concentration range of 30 to 0.014  $\mu$ M and analyzing for interferon ( $\alpha$ ) or tumor necrosis factor ( $\alpha$ ) in the culture supernatant. Compounds can be tested for inhibition of cytokine biosynthesis by incubating mouse macrophage cell line Raw 264.7 in a culture with the compound(s) at a single concentration of, for example, 5  $\mu$ M and analyzing for tumor necrosis factor ( $\alpha$ ) in the culture supernatant. Compounds can be further tested for dose response by running the test at several compound concentrations, for example, 0.03, 0.1, 0.3, 1, 3, 5, and 10  $\mu$ M. The ability to modulate cytokine biosynthesis makes the compounds useful in the treatment of a variety of conditions such as viral diseases, neoplastic diseases, and autoimmune diseases that are responsive to such changes in the immune response.

30

In another aspect, the present invention provides pharmaceutical compositions containing the immune response modifier compounds, and methods of modulating (e.g., inducing or inhibiting) cytokine biosynthesis in an animal, treating a viral disease in an animal, and treating a neoplastic disease in an animal, by administering an effective amount of one or more compounds of Formula I (and more specifically, of Formula II) and/or pharmaceutically acceptable salts thereof to the animal.

In another aspect, the invention provides methods of synthesizing compounds of Formulas I and II and intermediates useful in the synthesis of these compounds.

As used herein, "a," "an," "the," "at least one," and "one or more" are used interchangeably.

The terms "comprising" and variations thereof do not have a limiting meaning where these terms appear in the description and claims.

The above summary of the present invention is not intended to describe each disclosed embodiment or every implementation of the present invention. The description that follows more particularly exemplifies illustrative embodiments. Guidance is also provided herein through lists of examples, which can be used in various combinations. In each instance, the recited list

serves only as a representative group and should not be interpreted as an exclusive list.

Herein, "non-interfering" means that the ability of the compound or salt to modulate (e.g., induce or inhibit) the biosynthesis of one or more cytokines is not destroyed by the non-interfering substitutent. Illustrative non-interfering R' groups include those described above for  $R_1$  in Formula II. Illustrative non-interfering R" groups include those described above for  $R_2$  in Formula II.

As used herein, the terms "alkyl," "alkenyl," "alkynyl" and the prefix "alk-" are inclusive of both straight chain and branched chain groups and of cyclic groups, i.e. cycloalkyl and cycloalkenyl. Unless otherwise specified, these groups contain from 1 to 20 carbon atoms, with alkenyl groups containing from 2 to 20 carbon atoms, and alkynyl groups containing from 2 to 20 carbon atoms. In some embodiments, these groups have a total of up to 10 carbon atoms, up to 8 carbon atoms, up to 6 carbon atoms, or up to 4 carbon atoms. Cyclic groups can be monocyclic or polycyclic and preferably have from 3 to 10 ring carbon atoms. Exemplary cyclic groups include cyclopropyl, cyclopropylmethyl, cyclopentyl, cyclohexyl, adamantyl, and substituted and unsubstituted bornyl, norbornyl, and norbornenyl.

Unless otherwise specified, "alkylene," "alkenylene," and "alkynylene" are the divalent forms of the "alkyl," "alkenyl," and "alkynyl" groups defined above. Likewise, "alkylenyl," "alkenylenyl," and "alkynylenyl" are the divalent forms of the "alkyl," "alkenyl," and "alkynyl" groups defined above. For example, an arylalkylenyl group comprises an alkylene moiety to which an aryl group is attached.

# Preparation of the Compounds

Compounds of the invention can be prepared using known palladium catalyzed coupling reactions such as Suzuki coupling, Stille coupling, Sonogashira coupling, and the Heck reaction.

Suzuki coupling is used in Reaction Scheme I where  $R_1$ ,  $R_2$ , and R are as defined above,  $R_{3a}$  is  $-Z_a$ -Ar,  $-Z_a$ -Ar'-Y-R<sub>4</sub>, or  $-Z_a$ -Ar'-X-Y-R<sub>4</sub> where  $Z_a$  is a bond, alkylene or alkenylene, and Hal is bromo, chloro or iodo.

In Reaction Scheme I a halogen substituted imidazoquinoline of Formula IX is coupled with a boronic acid of Formula X to provide an imidazoquinoline of Formula XI which is a subgenus of Formula II. A compound of Formula IX is combined with a boronic acid of Formula X in the presence of palladium (II) acetate, triphenylphosphine and a base such as sodium carbonate in a suitable solvent such as n-propanol. The reaction can be carried out at an elevated temperature (e.g., 80-100°C).

Many boronic acids of Formula X are commercially available; others can be readily prepared using known synthetic methods. See, for example, Li, W. et al, J. Org. Chem., 67, 5394-5397 (2002). The Suzuki coupling reaction can also be carried out using boronic acid esters of Formula R<sub>3a</sub>-B(O-alkyl)<sub>2</sub> and anhydrides of boronic acids of Formula X.

Compounds of the invention where Z is alkynylene can be prepared using Stille coupling to couple a halogen substituted imidazoquinoline of Formula IX with a terminal alkyne of the formula -C=C-Ar.

Compounds of the invention can be prepared according to Reaction Scheme II wherein  $R_b$  is selected from alkyl, and alkoxy;  $R_{1b}$  and  $R_{2b}$  are subsets of  $R_1$  and  $R_2$  as defined above, which subsets do not include those substituents which one skilled in the art would recognize as being susceptible to oxidation in step (9), examples include substituents containing an -S- or a heteroaryl group;  $R_{3b}$  is aryl which may be unsubstituted or substituted by one or more substituents independently selected from alkyl, alkoxy, haloalkyl, haloalkoxy, halogen, nitro, cyano, carboxy, formyl, aryl, aryloxy, arylalkoxy, heterocyclyl, heterocyclylalkyl, amino, alkylamino, and dialkylamino; and n is 0 or 1.

In step (1) of Reaction Scheme II a bromoaniline of Formula XII is coupled with a boronic acid of formula  $R_{3b}$ -B(OH)<sub>2</sub>, an anhydride thereof, or a boronic acid ester of Formula  $R_{3a}$ -B(O-alkyl)<sub>2</sub> using the method described in Reaction Scheme I to provide an aryl substituted aniline of Formula XIII. Many bromoanilines of Formula XIII are commercially available; others can be readily prepared using known synthetic methods.

In step (2) of Reaction Scheme II an aryl substituted aniline of Formula XIII is reacted with a mixture of triethyl orthoformate and Meldrum's Acid (2,2-dimethyl-1,3-dioxane-4,6-dione) at an elevated temperature (50-55°C) to provide a compound of Formula XIV.

In step (3) of Reaction Scheme II a quinolin-4-ol of Formula XV is prepared by thermolysis of a compound of Formula XIV. The reaction can be carried out by heating (approximately 215°C) a solution of the compound of Formula XIV in a heat transfer fluid.

5

In step (4) of Reaction Scheme II a quinolin-4-ol of Formula XV is nitrated using conventional nitration methods to provide a 3-nitroquinolin-4-ol of Formula XVI. The reaction can be carried out by combining the compound of Formula XV with nitric acid in a suitable solvent such as propionic acid at an elevated temperature (approximately 130°C).

10

In step (5) of Reaction Scheme II a 3-nitroquinolin-4-ol of Formula XVI is chlorinated using conventional chlorinating methods to provide a 4-chloro-3-nitroquinoline of Formula XVII. The reaction can be carried out by combining the compound of Formula XVI with phosphorous oxychloride in a suitable solvent such as toluene. The reaction can be carried out at ambient temperature.

15

In step (6) of Reaction Scheme II a 4-chloro-3-nitroquinoline of Formula XVII is reacted with an amine of Formula R<sub>1b</sub>-NH<sub>2</sub> to provide a 3-nitroquinolin-4-amine of Formula XVIII. The reaction can be carried out by adding the amine to a solution of the compound of Formula XVII in a suitable solvent such as *N,N*-dimethylformamide (DMF) in the presence of a tertiary amine such as triethylamine. The addition can be carried out at a reduced temperature (0°C) or at ambient temperature.

20

25

In step (7) of Reaction Scheme II a 3-nitroquinolin-4-amine of Formula XVIII is reduced to provide a quinoline-3,4-diamine of Formula XIX. The reaction can be carried out using a conventional heterogeneous hydrogenation catalyst such as platinum on carbon or palladium on carbon. The reaction can conveniently be carried out on a Parr apparatus in a suitable solvent such as toluene, isopropanol, or mixtures thereof.

30

Alternatively the reduction in step (7) can be carried out using sodium dithionite. A solution or suspension of the compound of Formula XVIII in a suitable solvent such as ethanol or isopropanol is treated with an aqueous solution of sodium dithionite. The reaction can be carried out at an elevated temperature (reflux) or at ambient temperature.

In step (8) of Reaction Scheme II a quinoline-3,4-diamine of Formula XIX is reacted with a carboxylic acid or an equivalent thereof to provide a 1H-imidazo[4,5-c]quinoline of Formula XX. Suitable equivalents to carboxylic acid include orthoesters, and 1,1-dialkoxyalkyl alkanoates. The carboxylic acid or equivalent is selected such that it will provide the desired  $R_{2b}$  substituent in a compound of Formula XX. For example, triethyl orthoformate will provide a compound where  $R_{2b}$  is hydrogen and trimethyl orthovalerate will provide a compound where  $R_{2b}$  is butyl. The reaction can be run in the absence of solvent or in an inert solvent such as toluene. The reaction is run with sufficient heating to drive off any alcohol or water formed as a byproduct of the reaction. Optionally a catalyst such as pyridine hydrochloride can be included.

5

10

15

20

25

30

Alternatively, step (8) can be carried out by (i) reacting a compound of Formula XIX with an acyl halide of formula R<sub>2b</sub>C(O)Cl or R<sub>2b</sub>C(O)Br and then (ii) cyclizing. In part (i) the acyl halide is added to a solution of a compound of Formula XIX in an inert solvent such as acetonitrile, pyridine or dichloromethane. The reaction can be carried out at ambient temperature. Optionally a catalyst such as pyridine hydrochloride can be included. In part (ii) the product of part (i) is heated in pyridine. If step (i) is run in pyridine, then the two steps can be combined into a single step.

In step (9) of Reaction Scheme II a 1*H*-imidazo[4,5-*c*]quinoline of Formula XX is oxidized to provide an N-oxide of Formula XXI using a conventional oxidizing agent that is capable of forming N-oxides. The reaction can be carried out by treating a solution of a compound of Formula XX in a suitable solvent such as chloroform or dichloromethane with 3-chloroperoxybenzoic acid at ambient temperature.

In step (10) of Reaction Scheme II an N-oxide of Formula XXI is aminated to provide a 1H-imidazo[4,5-c]quinoline-4-amine of Formula XXII which is a subgenus of Formula II. The reaction is carried out in two parts. In part (i) a compound of Formula XXI is reacted with an acylating agent. Suitable acylating agents include alkyl- or arylsulfonyl chorides (e.g., benzenesulfonyl choride, methanesulfonyl choride, and p-toluenesulfonyl chloride). In part (ii) the product of part (i) is reacted with an excess of an aminating agent. Suitable

aminating agents include ammonia (e.g. in the form of ammonium hydroxide) and ammonium salts (e.g., ammonium carbonate, ammonium bicarbonate, ammonium phosphate). The reaction can be carried out by dissolving a compound of Formula XXI in a suitable solvent such as dichloromethane or chloroform, adding ammonium hydroxide to the solution, and then adding *p*-toluenesulfonyl chloride. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

# Reaction Scheme II

$$(R_{b})_{n} = \begin{pmatrix} (1) & & & & \\ & & &$$

For some embodiments, compounds shown in Reaction Scheme II can be further elaborated using conventional synthetic methods. For example, an amine of Formula  $R_{1b}$ -NH<sub>2</sub>, where  $R_{1b}$  is  $R_{4b}$  and  $R_{4b}$  is a subset of  $R_4$  that does not include those substitutents which one skilled in the art would recognize as being

susceptible to oxidation in step (9), may be substituted by a hydroxy or second amino group, which can be further functionalized before step (7) of Reaction Scheme II. For example, a 3-nitroquinolin-4-amine of Formula XVIII, in which R<sub>1b</sub> is R<sub>4b</sub> having an amino substituent, can react with an acid chloride of Formula R<sub>4b</sub>C(O)Cl, a sulfonyl chloride of Formula R<sub>4b</sub>S(O)<sub>2</sub>Cl, or a sulfonic anhydride of Formula (R<sub>4b</sub>S(O)<sub>2</sub>)<sub>2</sub>O to provide a compound of Formula XVIII in which R<sub>1b</sub> is -X-Y-R<sub>4b</sub>, where Y is -N(R<sub>8</sub>)-Q-, R<sub>8</sub> is as defined above, and Q is -C(O)- or -SO<sub>2</sub>-. Numerous acid chlorides, sulfonyl chlorides, and sulfonic anhydrides are commercially available; others can be readily prepared using known synthetic methods. The reaction can be conveniently carried out by adding an acid chloride of Formula R<sub>4b</sub>C(O)Cl, a sulfonyl chloride of Formula R<sub>4b</sub>S(O)<sub>2</sub>Cl, or a sulfonic anhydride of Formula (R<sub>4b</sub>S(O)<sub>2</sub>)<sub>2</sub>O to a solution of a 3-nitroquinolin-4-amine of Formula XVIII, in which R<sub>1b</sub> is R<sub>4b</sub> having an amino substituent, and a base such as triethylamine in a suitable solvent such as dichloromethane. The reaction can be carried out at ambient temperature.

A 3-nitroquinolin-4-amine of Formula XVIII, in which  $R_{1b}$  is  $R_{4b}$  having an amino substituent, can also react with isocyanates of Formula  $R_{4b}N$ =C=O to provide a compound of Formula XVIII in which  $R_{1b}$  is -X-Y- $R_{4b}$ , where Y is -N( $R_8$ )-Q-,  $R_8$  is as defined above, and Q is -C( $R_6$ )-N( $R_8$ )-W-,  $R_6$  is =O, and W is a bond. Numerous isocyanates of Formula  $R_{4b}N$ =C=O are commercially available; others can be readily prepared using known synthetic methods. The reaction can be conveniently carried out by adding the isocyanate of Formula  $R_{4b}N$ =C=O to a solution of the 3-nitroquinolin-4-amine of Formula XVIII, in which  $R_{1b}$  is  $R_{4b}$  having an amino substituent, in a suitable solvent such as dichloromethane. The reaction can be carried out at ambient temperature. Alternatively, a compound of Formula XVIII can be treated with an isocyanate of Formula  $R_{4b}(CO)N$ =C=O, a thioisocyanate of Formula  $R_{4b}N$ =C=S, a sulfonyl isocyanate of Formula  $R_{4b}S(O)_2N$ =C=O, or a carbamoyl chloride of Formula  $R_{4b}N$ -( $R_8$ )-C(O)Cl or

to provide a compound of Formula XVIII, where  $R_{1b}$  is -X-N( $R_8$ )-Q- $R_{4b}$  or

Q is  $-C(R_6)-N(R_8)-W$ -, and  $R_6$ ,  $R_8$ , and W are as defined above. The product can then be treated according to steps (7) through (10) of Reaction Scheme II to provide 1H-imidazo[4,5-c]quinolin-4-amine of Formula XXII.

Compounds of the invention, where  $R_{1c}$  is -X-Y- $R_{4b}$  or -X- $R_5$ ; Y is -N( $R_8$ )-Q-;  $R_5$  is

or R<sub>7</sub>; and X, Q, R, R<sub>2</sub>, R<sub>3a</sub>, R<sub>4b</sub>, and n are as defined above can be prepared according to Reaction Scheme III. Steps (1) through (4) of Reaction Scheme III are carried out as described for steps (2) through (5) of Reaction Scheme II.

In step (5) of Reaction Scheme III, a 4-chloro-3-nitroquinoline of Formula XXVII is treated with a Boc-protected diamine of Formula (CH<sub>3</sub>)<sub>3</sub>CO-C(O)-NH-X-NH<sub>2</sub> to provide a protected 3-nitroquinolin-4-amine of Formula XXVIII. Several Boc-protected diamines of Formula (CH<sub>3</sub>)<sub>3</sub>CO-C(O)-NH-X-NH<sub>2</sub> are commercially available; others can be prepared by known synthetic methods. The reaction is conveniently carried out by adding a solution of the Boc-protected diamine of Formula (CH<sub>3</sub>)<sub>3</sub>CO-C(O)-NH-X-NH<sub>2</sub> to a cooled solution of a 4-chloro-3-nitroquinoline of Formula XXVII in a

suitable solvent such as dichloromethane in the presence of a tertiary amine such as triethylamine. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods.

In steps (6) and (7) of Reaction Scheme III, a 3-nitroquinolin-4-amine of Formula XXVIII is first reduced to provide a quinoline-3,4-diamine of Formula XXIX, which is converted to 1*H*-imidazo[4,5-*c*]quinoline of Formula XXX by reaction with a carboxylic acid equivalent. Steps (6) and (7) of Reaction Scheme III can be carried out as described for steps (7) and (8) of Reaction Scheme II. The sodium dithionite reduction in step (6) can also be conveniently carried out in a mixture of dichloromethane and water at ambient temperature in the presence of potassium carbonate and 1,1'-di-*n*-octyl-4,4'-bipyridinium

dibromide. In part (ii) of step (7), the cyclization can also be carried out in ethanol while heated at reflux.

In step (8) of Reaction Scheme III, the Boc-protecting group of a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXX is removed to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI. The reaction is conveniently carried out by adding hydrochloric acid or a solution of hydrochloric acid in ethanol to a solution of a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXX in a suitable solvent such as ethanol. The reaction can be carried out at an elevated temperature, for example, the reflux temperature of the solvent. The product or pharmaceutically acceptable salt thereof can be isolated by conventional methods.

In step (9) of Reaction Scheme III, an amino-substituted 1H-imidazo[4,5-c]quinoline of Formula XXXII is converted to a 1H-imidazo[4,5-c]quinolin-1-yl compound of Formula XXXII, where  $R_{1c}$  is as defined above, using conventional methods. For example, a 1H-imidazo[4,5-c]quinoline of Formula XXXII can react with an acid chloride of Formula  $R_{4b}C(O)Cl$  to provide a compound of Formula XXXII in which  $R_{1c}$  is -X-Y- $R_{4b}$ , Y is -N( $R_8$ )-Q-, and Q is -C(O)-. In addition, a 1H-imidazo[4,5-c]quinoline of Formula XXXII can react with sulfonyl chloride of Formula  $R_{4b}S(O)_2Cl$  or a sulfonic anhydride of Formula  $R_{4b}S(O)_2O$ 0 to provide a compound of Formula XXXII in which  $R_{1c}$  is -X-Y- $R_{4b}$ , Y is -N( $R_8$ )-Q-, and Q is -S(O)<sub>2</sub>-. Numerous acid chlorides of Formula  $R_{4b}C(O)Cl$ , sulfonyl chlorides of Formula  $R_{4b}S(O)_2Cl$ , and sulfonic anhydrides of Formula ( $R_{4b}S(O)_2O$ 2) are commercially available; others can be readily prepared using known synthetic methods. The reaction can be carried out as described above for a compound of Formula XVIII.

Ureas of Formula XXXII, where  $R_{1c}$  is -X-Y- $R_{4b}$ , Y is -N( $R_8$ )-Q-, Q is -C( $R_6$ )-N( $R_8$ )-W-, and W and  $R_8$  are as defined above can be prepared by reacting a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI with isocyanates of Formula  $R_4$ N=C=O or Formula  $R_4$ (CO)N=C=O, thioisocyanates of Formula  $R_4$ N=C=S, sulfonyl isocyanates of Formula  $R_4$ S(O)<sub>2</sub>N=C=O, or carbamoyl chlorides of Formula  $R_4$ N-( $R_8$ )-C(O)Cl. Numerous compounds of these types are commercially available; others can be readily prepared using known

synthetic methods. The reaction can be carried out as described above for a compound of Formula XVIII.

Compounds of Formula XXXII where R<sub>1c</sub> is -X-R<sub>5</sub> and R<sub>5</sub> is

The reaction is conveniently carried out by adding the chloroalkanesulfonyl chloride to a solution of the amino-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI in a suitable solvent such as chloroform at ambient temperature.

The isolable intermediate chloroalkanesulfonamide can then be treated with a base such as 1,8-diazabicyclo[5.4.0]undec-7-ene at ambient temperature in a suitable solvent such as DMF to effect the cyclization. The product can be isolated using conventional methods.

In steps (10) and (11) of Reaction Scheme III, a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXII is oxidized to afford a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XXXIII, which is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXXIV. Steps (10) and (11) of Reaction Scheme III can be carried out as described for steps (9) and (10), respectively, of Reaction Scheme II.

In step (12) of Reaction Scheme III, a 1H-imidazo[4,5-c]quinolin-4-amine of Formula XXXIV undergoes a coupling reaction with boronic acid of Formula X, an anhydride thereof, or a boronic acid ester of Formula  $R_{3a}$ -B(O-alkyl)<sub>2</sub>. The Suzuki coupling reaction can be carried out as described in Reaction Scheme I to provide a 1H-imidazo[4,5-c]quinolin-4-amine of Formula XXXV, which is a subgenus of Formula II. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Compounds of the invention can also be prepared according to Reaction Scheme IV, where R, R<sub>2</sub>, R<sub>3a</sub>, R<sub>4</sub>, R<sub>10</sub>, X, and Q are as defined above. In step (1) of Reaction Scheme IV, a 4-chloro-3-nitroquinoline of Formula XXVII is treated with a Boc-protected diamine of Formula XXXVII to provide a 3-nitroquinolin-4-amine of Formula XXXVII. Boc-protected diamines of Formula XXXVII are available from the method described by Carceller, E. et al, *J. Med. Chem.*, 39, 487-493 (1996). The reaction can be carried out as described for step (5) of Reaction Scheme III.

5

10

In steps (2)-(5) of Reaction Scheme IV, a 3-nitroquinolin-4-amine of Formula XXXVII is first reduced to provide a quinoline-3,4-diamine of Formula XXXVIII, which is converted to 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXIX by reaction with a carboxylic acid equivalent. The 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXIX is then oxidized to afford a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XL, which is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XLI. Steps (2), (3), (4), and (5) of Reaction Scheme IV can be carried out as described for steps (7), (8), (9), and (10), respectively, of Reaction Scheme II.

5

10

15

20

In steps (6) of Reaction Scheme IV, the Boc protecting group of a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XLI is removed to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XLII, which is converted to a 1*H*-imidazo[4,5-*c*]quinolinyl compound of Formula XLIII in step (7). Steps (6) and (7) of Reaction Scheme IV can be carried out as described for steps (8) and (9) of Reaction Scheme III.

In step (8), the compound of Formula XLIII is then coupled with a boronic acid of Formula X, an anhydride thereof, or boronic acid ester of Formula  $R_{3a}$ -B(O-alkyl)<sub>2</sub> to provide a 1H-imidazo[4,5-c]quinolin-4-amine of Formula XLIV, which is a subgenus of Formula II. The Suzuki coupling reaction can be carried out as described in Reaction Scheme I. In some embodiments, the coupling reaction shown in step (8) is carried out prior to the deprotection and functionalization reactions shown in steps (6) and (7) to provide a compound of Formula XLIV. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

# Reaction Scheme IV

The Heck reaction can be used to prepare compounds of the invention as shown in step (1) of Reaction Scheme V, wherein R<sub>1</sub>, R<sub>2</sub>, R, Hal, and n are as defined above and Ar<sub>a</sub> is -Ar, -Ar'-Y-R<sub>4</sub>, or -Ar'-X-Y-R<sub>4</sub>. In step (1) of Reaction Scheme V, a halogen-substituted imidazoquinolin-4-amine of Formula IX is coupled with a vinyl-substituted compound of Formula L to provide an imidazoquinolin-4-amine of Formula LI, which is a subgenus of Formula II. Alternatively, a compound of Formula L can be coupled with a trifluoromethanesulfonate-substituted imidazoquinolin-4-amine, in which Hal in Formula IX is replaced by -OSO<sub>2</sub>CF<sub>3</sub>. Several compounds of Formula L are commercially available; others can be prepared by known methods. The reaction is conveniently carried out by combining the imidazoquinolin-4-amine

of Formula IX and the vinyl-substituted compound of Formula L in the presence of palladium (II) acetate, triphenylphosphine or tri-*ortho*-tolylphosphine, and a base such as triethylamine in a suitable solvent such as acetonitrile or toluene. The reaction can be carried out at an elevated temperature such as 100-120 °C under an inert atmosphere. The compound or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

In step (2) of Reaction Scheme V, the vinyl group of an imidazoquinolin-4-amine of Formula LI is reduced to provide an imidazoquinolin-4-amine of Formula LII, which is also a subgenus of Formula II. The reduction can be carried out by hydrogenation using a conventional heterogeneous hydrogenation catalyst such as palladium on carbon. The reaction can conveniently be carried out on a Parr apparatus in a suitable solvent such as ethanol, methanol, or mixtures thereof. Palladium-catalyzed coupling reactions can also be used to prepare compounds of the invention according to Reaction Scheme VI, wherein  $R_1$ ,  $R_2$ ,  $R_9$ , R, Hal,  $Ar_a$ , and n are as defined above. In step (1) of Reaction Scheme VI, a halogen-substituted imidazoquinolin-4-amine of Formula IX undergoes a

Suzuki-type coupling with a potassium alkenyltrifluoroborate of Formula LIII to provide an imidazoquinolin-4-amine of Formula XLVII. The reaction is conveniently carried out by combining the imidazoquinolin-4-amine of Formula IX and a compound of Formula LIII, such as potassium vinyltrifluoroborate, in the presence of dichloro[1,1'-bis(diphenylphosphino)ferrocene]palladium (II) dichloromethane adduct and a base such as triethylamine in a suitable solvent such as *n*-propanol. The reaction can be carried out at an elevated temperature such as the reflux temperature of the solvent under an inert atmosphere. VII, a Suzuki coupling is carried out with an imidazoquinolin-4-amine of

Formula LIV and a difunctional boronic acid of Formula LV, or an ester or
anhydride thereof. Some boronic acids of Formula LV are commercially
available; others can be prepared by known synthetic methods. The coupling

can be carried out as described in Reaction Scheme I to provide a dimer of
Formula XLVI. The compound or pharmaceutically acceptable salt thereof can
be isolated using conventional methods.

## Reaction Scheme VII

Compounds of the invention can also be prepared according to Reaction Scheme VIII, wherein R, R<sub>3a</sub>, n, and Hal are as defined above, and R<sub>1d</sub> and R<sub>2d</sub> are subsets of R<sub>1</sub> and R<sub>2</sub> that do not include substituents that one skilled in the art would recognize as being susceptible to nucleophilic attack in step (5). These groups include, for example, esters and ureas. In step (1) of Reaction Scheme VIII, a nitro-substituted quinoline-2,4-diol of Formula LVI is chlorinated to provide a 2,4-dichloroquinoline of Formula LVII. Nitro-substituted quinoline-2,4-diols of Formula LVI can be prepared from substituted anilines according to the methods described in Buckle *et al*, *J. Med. Chem.*, 18, 726-732 (1975). The chlorination is conveniently carried out by heating the compound of Formula LVI and phenylphosphonic dichloride at an elevated temperature such as 140 °C. The reaction can be carried out without solvent, and the product can be isolated using conventional methods.

In step (2) of Reaction Scheme VIII, a 2,4-dichloroquinoline of Formula LVII is reacted with an amine of Formula R<sub>1</sub>-NH<sub>2</sub> to provide a 2-chloro-3-nitroquinolin-4-amine of Formula LVIII. The reaction can be carried out as described in step (6) of Reaction Scheme II.

In step (3) of Reaction Scheme VIII, the nitro group of a 2-chloro-3-nitroquinolin-4-amine of Formula LVIII is reduced to provide a 2-chloroquinoline-3,4-diamine of Formula LIX. The reduction is conveniently

carried out with sodium dithionite according to the method described in step (7) of Reaction Scheme II.

In step (4) of Reaction Scheme VIII, a 2-chloroquinoline-3,4-diamine of Formula LIX is treated with a carboxylic acid or an equivalent thereof to provide a 4-chloro-1*H*-imidazo[4,5-*c*]quinoline of Formula LX. The reaction can be carried out as described in step (8) of Reaction Scheme II.

5

10

15

20

In step (5) of Reaction Scheme VIII, a 4-chloro-1*H*-imidazo[4,5-*c*]quinoline of Formula LX is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXI. The reaction is conveniently carried out by combining the compound of Formula LX with a solution of ammonia in methanol in a bomb reactor and heating at an elevated temperature, such as 120 °C. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

In step (6) of Reaction Scheme VIII, a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXI undergoes a coupling reaction with a boronic acid of Formula X, an anhydride thereof, or a boronic acid ester of Formula R<sub>3a</sub>-B(O-alkyl)<sub>2</sub>. The Suzuki coupling reaction can be carried out as described in Reaction Scheme I to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXII, which is a subgenus of Formula II. 10

15

In steps (2) and (3) of Reaction Scheme IX, a 3-nitroquinolin-4-amine of Formula LXIV is first reduced to provide a quinoline-3,4-diamine of Formula LXV, which is converted to 1*H*-imidazo[4,5-*c*]quinoline of Formula LXVI by reaction with a carboxylic acid equivalent. Step (2) of Reaction Scheme IX can be carried out as described for step (7) of Reaction Scheme II or step (8) of

Reaction Scheme III. Step (3) of Reaction Scheme IX can be carried out as described for step (8) of Reaction Scheme II.

The 1*H*-imidazo[4,5-*c*]quinoline of Formula LXVI is then oxidized in step (4) of Reaction Scheme IX to afford a dioxido-1*H*-imidazo[4,5-*c*]quinoline of Formula LXVII. In step (1) of Reaction Scheme XI, the hydroxy group of a 3-nitroquinolin-4-amine of Formula LXXX is chlorinated using conventional methods to provide a 3-nitroquinolin-4-amine of Formula LXXXI. Many 3-nitroquinolin-4-amines of Formula LXXIII are known or can be prepared using known synthetic methods, see for example, U.S. Patent Nos. 4,689,338; 5,175,296; and 5,389,640; and the references cited therein. The chlorination is conveniently carried out by adding thionyl chloride to a solution of the 3-nitroquinolin-4-amine of Formula LXXX in a suitable solvent such as

dichloromethane. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods.

In step (2) of Reaction Scheme XI, a 3-nitroquinolin-4-amine of Formula LXXXI is reduced to provide a quinoline-3,4-diamine of Formula LXXXII. In step (5) of Reaction Scheme XI, the thioacetate group of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXIV is hydrolyzed under basic conditions to provide a thiol-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXV. The reaction is conveniently carried out by adding a solution of sodium methoxide in methanol to a solution of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXIV in methanol. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods.

In step (6) of Reaction Scheme XI, the thiol group of a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXXXV is oxidized to a sulfonyl chloride of Formula LXXXVI. 30

In step (5a) of Reaction Scheme XI, the thiourea group of a 1H-imidazo[4,5-c]quinoline of Formula LXXXVII is converted to a sulfonyl chloride of Formula LXXXVI under the conditions described in step (6).

Pharmaceutical Compositions and Biological Activity

Pharmaceutical compositions of the invention contain a therapeutically effective amount of a compound of the invention as described above in combination with a pharmaceutically acceptable carrier.

20

25

The term "therapeutically effective amount" or "effective amount" means an amount of the compound sufficient to induce a therapeutic or prophylactic effect, such as cytokine induction, cytokine inhibition, immunomodulation, antitumor activity, and/or antiviral activity. Although the exact amount of active compound used in a pharmaceutical composition of the invention will vary according to factors known to those of skill in the art, such as the physical and chemical nature of the compound, the nature of the carrier, and the intended dosing regimen, it is anticipated that the compositions of the invention will contain sufficient active ingredient to provide a dose of about 100 ng/kg to about

50 mg/kg, preferably about 10 μg/kg to about 5 mg/kg, of the compound to the subject. A variety of dosage forms may be used, such as tablets, lozenges, capsules, parenteral formulations, syrups, creams, ointments, aerosol formulations, transdermal patches, transmucosal patches and the like.

5

The compounds of the invention can be administered as the single therapeutic agent in the treatment regimen, or the compounds of the invention may be administered in combination with one another or with other active agents, including additional immune response modifiers, antivirals, antibiotics, antibodies, proteins, peptides, oligonucleotides, etc.

10

Compounds of the invention have been shown to modulate (e.g., induce or inhibit) the production of certain cytokines in experiments performed according to the tests set forth below. These results indicate that compounds of the invention are useful as immune response modifiers that can modulate the immune response in a number of different ways, rendering them useful in the treatment of a variety of disorders.

15

20

25

Cytokines whose production may be induced by the administration of certain compounds according to the invention generally include interferon-a (IFN- $\alpha$ ) and/or tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ) as well as certain interleukins (IL). Cytokines whose biosynthesis may be induced by certain compounds of the invention include IFN-α, TNF-α, IL-1, IL-6, IL-10 and IL-12, and a variety of other cytokines. Among other effects, these and other cytokines can inhibit virus production and tumor cell growth, making the compounds useful in the treatment of viral diseases and neoplastic diseases. Accordingly, the invention provides a method of inducing cytokine biosynthesis in an animal comprising administering an effective amount of a compound or composition of the invention to the animal. The animal to which the compound or composition is administered for induction of cytokine biosynthesis may have a disease as described infra, for example a viral disease or a neoplastic disease, and administration of the compound may provide therapeutic treatment. Alternatively, the compound may be administered to the animal prior to the animal aquiring the disease so that administration of the compound may provide

30

a prophylactic treatment.

In addition to the ability to induce the production of cytokines, certain compounds of the invention affect other aspects of the innate immune response. For example, natural killer cell activity may be stimulated, an effect that may be due to cytokine induction. Certain compounds may also activate macrophages, which in turn stimulate secretion of nitric oxide and the production of additional cytokines. Further, certain compounds may cause proliferation and differentiation of B-lymphocytes.

5

10

15

20

25

30

Certain compounds of the invention also have an effect on the acquired immune response. For example, the production of the T helper type 1 ( $T_H1$ ) cytokine IFN- $\gamma$  is induced indirectly and the production of the T helper type 2 ( $T_H2$ ) cytokines IL-4, IL-5 and IL-13 are inhibited upon administration of compounds of the invention.

Other cytokines whose production is inhibited by the administration of certain compounds according to the invention include tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ). Among other effects, inhibition of TNF- $\alpha$  production can provide prophylaxis or therapeutic treatment of diseases in animals in which TNF is mediated, making the compounds useful in the treatment of, for example, autoimmune diseases. Accordingly, the invention provides a method of inhibiting TNF- $\alpha$  biosynthesis in an animal comprising administering an effective amount of a compound or composition of the invention to the animal. The animal to which the compound or composition is administered for inhibition of TNF- $\alpha$  biosynthesis may have a disease as described *infra*, for example an autoimmune disease, and administration of the compound may provide therapeutic treatment. Alternatively, the compound may be administered to the animal prior to the animal aquiring the disease so that administration of the compound may provide a prophylactic treatment.

Whether for prophylaxis or therapeutic treatment of a disease, and whether for effecting innate or acquired immunity, the compound or composition may be administered alone or in combination with one or more active components as in, for example, a vaccine adjuvant. When administered with other components, the compound and other component or components may be administered separately; together but independently such as in a solution; or

together and associated with one another such as (a) covalently linked or (b) non-covalently associated, e.g., in a colloidal suspension.

Conditions for which IRMs identified herein may be used as treatments include, but are not limited to:

IRMs identified herein also may be useful as a vaccine adjuvant for use in conjunction with any material that raises either humoral and/or cell mediated immune response, such as, for example, live viral, bacterial, or parasitic immunogens; inactivated viral, tumor-derived, protozoal, organism-derived, fungal, or bacterial immunogens, toxoids, toxins; self-antigens; polysaccharides; proteins; glycoproteins; peptides; cellular vaccines; DNA vaccines; recombinant proteins; glycoproteins; peptides; and the like, for use in connection with, for example, BCG, cholera, plague, typhoid, hepatitis A, hepatitis B, hepatitis C, influenza A, influenza B, parainfluenza, polio, rabies, measles, mumps, rubella, yellow fever, tetanus, diphtheria, hemophilus influenza b, tuberculosis, meningococcal and pneumococcal vaccines, adenovirus, HIV, chicken pox, cytomegalovirus, dengue, feline leukemia, fowl plague, HSV-1 and HSV-2, hog cholera, Japanese encephalitis, respiratory syncytial virus, rotavirus, papilloma virus, yellow fever, and Alzheimer's Disease.

IRMs may also be particularly helpful in individuals having compromised immune function. For example, IRM compounds may be used for treating the opportunistic infections and tumors that occur after suppression of cell mediated immunity in, for example, transplant patients, cancer patients and HIV patients.

Thus, one or more of the above diseases or types of diseases, for example, a viral disease, a neoplastic disease, may be treated in an animal in need there of (having the disease) by administering a therapeutically effective amount of a compound or salt of Formula I, II, III, IV, V, VI, VII, VIII, XLVI, or a combination thereof to the animal.

An amount of a compound effective to induce or inhibit cytokine biosynthesis is an amount sufficient to cause one or more cell types, such as monocytes, macrophages, dendritic cells and B-cells to produce an amount of

5

20

25

30

one or more cytokines such as, for example, IFN-α, TNF-α, IL-1, IL-6, IL-10 and IL-12 that is increased (induced) or decreased (inhibited) over a background level of such cytokines. The precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10 µg/kg to about 5 mg/kg. The invention also provides a method of treating a viral infection in an animal and a method of treating a neoplastic disease in an animal comprising administering an effective amount of a compound or composition of the invention to the animal. An amount effective to treat or inhibit a viral infection is an amount that will cause a reduction in one or more of the manifestations of viral infection, such as viral lesions, viral load, rate of virus production, and mortality as compared to untreated control animals. In addition to the formulations and uses described specifically herein, other formulations, uses, and administration devices suitable for compounds of the present invention are described in, for example, International Publication Nos. WO 03/077944, WO 03/080114, WO 03/045494, WO 02/024225, WO 02/036592, U.S. Patent No. 6,245,776, and U.S. Publication Nos. 2002/0193729 and 2003/0139364.

### **EXAMPLES**

In the examples below some of the compounds were purified by preparative high performance liquid chromatography (prep HPLC) using a Waters Fraction Lynx automated purification system. The prep HPLC fractions were analyzed using a Micromass LC-TOFMS and the appropriate fractions were combined and centrifuge evaporated to provide the trifluoroacetate salt of the desired compound. In order to maximize purity, the compounds were sent through the purification process twice. Column: Phenomenex Luna C18(2), 21.2 x 50 millimeters (mm), 10 micron particle size, 100 Angstrom (Å) pore; flow rate: 25 milliliters per minutes (mL/min); non-linear gradient elution from 5-95% B in 9 min (first purification run) and from 5-65% B in 16 min (second purification run), then hold at 95% B for 2 min, where A is 0.05% trifluoroacetic acid/water and B is 0.05% trifluoroactic acid/acetonitrile; fraction collection by mass-selective triggering.

A variety of chromatographic conditions were used for the prep HPLC purification of other compounds shown in the examples below using either the Phenomenex Luna C18(2) column (21.2 x 50 millimeters (mm), 10 micron particle size) or a Waters Xterra C18 column (19 x 50 mm, 5 micron particle size). Elution was carried out in a non-linear gradient from 95:5 to 5:95 A:B, where A is 0.05% trifluoroacetic acid/water and B is 0.05% trifluoroactic acid/acetonitrile; fraction collection was performed by mass-selective triggering.

Some of the compounds prepared by Suzuki coupling were passed through a Waters Oasis Sample Extractions Cartridge MCX (6 cc) prior to prep HPLC purification. The following procedure was used. The product from the coupling reaction was dissolved in 1N hydrochloric acid (3 mL) to adjust to pH 5-7 and passed through the cartridge optionally using light nitrogen pressure. The cartridge was washed with methanol (5 mL) optionally using light nitrogen pressure and transferred to a clean test tube. A solution of 1% ammonia in methanol (2 x 5 mL) was then passed through the cartridge optionally using light nitrogen pressure, and the basic solution was collected and concentrated.

Part A

A mixture of triethyl orthoformate (154 grams (g), 1.04 moles (mol) and Meldrum's acid (142 g, 0.983 mol) was heated to 55°C for 4 hours (h). After cooling to 50°C, a solution of 3-bromoaniline (162.6 g, 0.945 mol) in ethanol (300 mL) was added such that the temperature of the reaction was maintained between 50-55°C. After half of the 3-bromoaniline had been added, stirring became difficult due to the formation of solids, so more ethanol (1 liter (L)) was added to facilitate stirring. Upon complete addition, the reaction was cooled to room temperature (RT), and the solids were collected by filtration. The filter cake was washed with ice cold ethanol until the washings were nearly colorless, and the product was dried at 65°C under vacuum to afford 287 g of 5-[(3-bromophenylamino)methylene]-2,2-dimethyl-[1,3]dioxane-4,6-dione as an off-white solid.

<sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>) δ 11.19 (brd, J = 12.8 Hz, 1H), 8.60 (d, J = 14.0 Hz, 1H), 7.44-7.38 (m, 2H), 7.30 (t, J = 8.0 Hz, 1H), 7.18 (ddd, J = 8.0, 2.2, 0.9 Hz, 1H), 1.75 (s, 6H).

Part B

Chem.*, 41, 4918-4926 (1998)) or by thermolysis of 5-[(3-bromophenylamino)methylene]-2,2-dimethyl-[1,3]dioxane-4,6-dione in DOWTHERM A heat transfer fluid and had the following spectral properties:

A stirred suspension of 7-bromoquinolin-4-ol (162 g, 0.723 mol) in propionic acid (1500 mL) was brought to 110°C. 70% Nitric acid (85 g) was added dropwise over 1 h such that the temperature was maintained between 110-115°C. After half of the nitric acid had been added, stirring became difficult due to the formation of solids and an additional 200 mL of propionic acid was added. Upon complete addition, the reaction was stirred for 1 h at 110°C, cooled to room temperature, and the solid was collected by filtration. The filter cake was washed with ice cold ethanol until the washings were nearly colorless (800 mL), and the product was dried at 60°C under vacuum to afford 152 g of 7-bromo-3-nitro-quinolin-4-ol as a pale yellow solid.

Part A

A solution of 3-bromoaniline (344 g, 2.00 mol) and phenyl boronic acid (268 g, 2.2 mol) in n-propanol (3.5 L) was sparged with  $N_2$  for 10 min. To this solution was added Pd(OAc)<sub>2</sub> (1.35 g, 6.0 mmol), triphenylphosphine (4.72 g, 18.0 mmol), Na<sub>2</sub>CO<sub>3</sub> (1.2 L of a 2 M solution, 2.4 mol), and H<sub>2</sub>O (700 mL). The reaction was brought to reflux under a N2 atmosphere over a period of 45 min and then cooled to RT and transferred to a separatory funnel. The clear aqueous layer was drawn off (1.1 L), and the organic layer was washed with brine (3x500 mL). The organic layer was treated with charcoal (90 g of Darco G-60) and MgSO<sub>4</sub> (160 g) and was filtered through CELITE filter agent, washing with ethyl acetate. The filtrate was concentrated (420 g of an orange oil), dissolved in 1.1 L of 1/1 hexane/isopropanol, filtered to remove insoluble solid and then diluted with an additional 1.9 L of 1/1 hexane/isopropanol. The resulting solution was cooled in an ice bath and then anhydrous HCl in ether (1.05 L of a 2 M solution, 2.1 mol) was added. The solid was collected by filtration, washed with 700 mL diethyl ether (Et<sub>2</sub>O), and dried at RT in a vacuum oven to obtain 345 g of the HCl salt of biphenyl-3-ylamine as yellow crystals. The free base was obtained by shaking the solid with tert-butyl methyl ether and 1 N NaOH followed by isolation in the usual fashion.

The compounds in the table below were prepared according to the following method. 8-Bromo-1-isobutyl-1H-imidazo[4,5-c]quinoline-4-amine (25 mg) was dissolved in 1:1 volume:volume (v:v) dichloromethane:methanol. An aliquot (2 mL, 1.0 equivalents (eq.)) was placed in a 2 dram (7.4 mL) vial. The solvent was removed by vacuum centrifugation. The vial was charged with the appropriate boronic acid (1.25 eq.), palladium (II) acetate (0.1 eq.), and n-propanol (900  $\mu$ L) and then sonicated for 30 seconds. The vial was then charged with 2M aqueous sodium carbonate solution (313  $\mu$ L), deionized water (63  $\mu$ L), and a solution of triphenylphosphine in n-propanol (63  $\mu$ L, 0.15 eq.). The vial was capped and then heated to 80°C for 5 hours in a sand bath. The vial was allowed to cool to room temperature and then the solvent was removed by vacuum centrifugation. The residue was purified by preparative high performance liquid chromatography using the method described above to provide the trifluoroacetate salt of the desired compound. The table below shows the structure of the free base and the measured mass (M + H).

3-Bromo-5-(*tert*-butyldimethylsilanyloxymethyl)pyridine was prepared according to the published procedure (Zhang, N. et al, *J. Med. Chem.*, 45, 2832-2840 (2002)). Under a nitrogen atmosphere, a solution of 3-bromo-5-(*tert*-butyldimethylsilanyloxymethyl)pyridine (28.70 g, 94.94 mmol) and triisopropyl borate (26.3 mL, 114 mmol) in dry THF was cooled to -70 °C. *n*-Butyllithium (45.6 mL, 114 mmol) was added dropwise over a period of 1.5 hours. The reaction was stirred for an additional 30 minutes and then allowed to warm to -20 °C. Dilute aqueous ammonium chloride was added, and the mixture was allowed to warm to ambient temperature. The aqueous layer was separated and extracted with diethyl ether. The combined organic fractions were concentrated

under reduced pressure, and methanol was added to the resulting oil. A solid formed, which was stirred with water for two days, isolated by filtration, and dried under reduced pressure to provide 18.19 g of 5-(tert-butyldimethylsilanyloxymethyl)pyridine-3-boronic acid as a white solid.

A reagent from the table below, (0.064 mmol, 1.1 equivalents) was added to a test tube containing a solution of 2-ethoxymethyl-1-(piperidin-4-ylmethyl)-7-(pyridin-3-yl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine trihydrochloride (30 mg, 0.057 mmol) and *N*,*N*-diisopropylethylamine (0.048 mL, 0.27 mmol, 4.8 equivalents) in chloroform (2 mL). The test tube was capped placed on a shaker at ambient temperature overnight. One drop of deionized water was then added to each test tube, and the solvent was removed by vacuum centrifugation. For Example 323, the capped test tube was heated at 60 °C overnight in a sand bath, and then lithium trifluoromethanesulfonimide (3 mg) was added followed by shaking for an additional four hours. The products were purified by prep HPLC according to the methods described above. The table below shows the reagent used for each example, the structure of the resulting compound, and the observed accurate mass for the isolated trifluoroacetate salt.

## Examples 440-463

## Part A

(7-Bromo-3-nitroquinolin-4-yl)-(2-methylpropyl)amine (117 g) was dissolved in hot toluene (2 L) and poured into stainless steel Parr vessel. Additional toluene (2 L) and 5% platinum on carbon (12.5 g) were added. The vessel was evacuated, charged with hydrogen (54 psi, 3.7 x 10<sup>5</sup> Pa), and shaken overnight at room temperature. The reaction mixture evacuated, filtered through a layer of CELITE filter aid, and concentrated under reduced pressure to provide 7-bromo-N<sup>4</sup>-(2-methylpropyl)quinoline-3,4-diamine, which was used without purification.

Part B

20

30

Butyryl chloride (1.1 equivalent) was slowly added to a stirred solution of 7-bromo- $N^4$ -(2-methylpropyl)quinoline-3,4-diamine (52.9 g, 0.18 mol.) in pyridine (700 mL) at room temperature. A pale yellow precipitate formed and then went into solution. The reaction mixture was heated at reflux for eight hours, and then allowed to slowly cool to room temperature over the weekend. The dark gold, turbid reaction mixture was concentrated under reduced pressure. The residue was dissolved in 1 N hydrochloric acid and then adjusted to pH 14 with the addition of 10% aqueous sodium hydroxide. A precipitate formed, was isolated by filtration, washed with water (3x100 mL), and dried overnight on the filter funnel to provide 7-bromo-1-(2-methylpropyl)-2-propyl-1H-imidazo[4,5-c]quinoline as an off-white solid.

Part C

To a stirred solution of 7-bromo-1-(2-methylpropyl)-2-propyl-1*H*-imidazo[4,5-*c*]quinoline (51.1 g, 0.148 mol) in dichloromethane (1 L) was slowly added 3-chloroperoxybenzoic acid (1.0 equivalent of 50% pure material) in small portions. The reaction was maintained at room temperature for one hour. Concentrated ammonium hydroxide (600 mL) was added with stirring. After 15 minutes, *p*-toluenesulfonyl chloride (1.1 equivalents.) was added in small portions. The reaction was stirred at room temperature overnight. The reaction was quenched by adding water (1 L) and stirred for an additional hour. A solid was present and was isolated by filtration to provide 7-bromo-1-(2-methylpropyl)-2-propyl-1*H*-imidazo[4,5-*c*]quinolin-4-amine as an off-white solid.

#### 25 Part D

Triethylamine (3.0 equivalents), potassium vinyltrifluoroborate (1.0 equivalent) and dichloro[1,1'-bis(diphenylphosphino)ferrocene]palladium (II) dichloromethane adduct (0.2 equivalent) were added to a solution of 7-bromo-1-(2-methylpropyl)-2-propyl-1*H*-imidazo[4,5-*c*]quinolin-4-amine (1.0 equivalent) in *n*-propanol (30 ml/g). The reaction mixture was heated at reflux under a nitrogen atmosphere until it was complete (between four and 18 hours) and then poured into water (3 volumes). The pH of the mixture was monitored and

adjusted to pH 12 with the addition of 10% aqueous sodium hydroxide if needed. The mixture was extracted with ethyl acetate, and the combined organic fractions were filtered and concentrated under reduced pressure. The crude product was purified by flash column chromatography on silica gel (eluting with chloroform:methanol in a gradient from 100:0 to 90:10), followed by recrystallization from acetonitrile to provide 1-(2-methylpropyl)-2-propyl-7-vinyl-1*H*-imidazo[4,5-*c*]quinolin-4-amine as an off-white solid. Part E

A thick-walled glass tube, equipped with magnetic stir-bar, was charged with acetonitrile (20 mL/g), palladium (II) acetate (0.1 equivalent), tri-orthotolylphosphine (0.3 equivalent), triethylamine (3.0 equivalent), 1-(2-methylpropyl)-2-propyl-7-vinyl-1H-imidazo[4,5-c]quinolin-4-amine (1.0 equivalent), and the aryl- or heteroaryl-halide (1.5 equivalents) shown in the table below. The tube was purged with nitrogen and sealed. The reaction mixture was heated at 120 °C for between 24 and 48 hours and then allowed to cool to ambient temperature. The solvent was removed under reduced pressure. The solid was then partitioned between dichloromethane and water; the mixture was adjusted to pH 12 with the addition of 10% aqueous sodium hydroxide if needed. The organic layer was separated and was purified by flash column chromatography on silica gel (eluting with chloroform:methanol in a gradient from 100:0 to 90:10) followed by recrystallization from acetonitrile to provide the compound shown in the table below.

A 4 dram vial containing a stir bar was charged sequentially with copper(I) iodide (0.038 g), potassium phosphate (0.890 g), pyrazole (0.164 g), 7-bromo-2-ethoxymethyl-1-(3-methoxypropyl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine (0.786 g), (±)-*trans*-1,2-diaminocyclohexane (0.030 mL), and anhydrous 1,4-dioxane (2mL). The vial was flushed with nitrogen, capped, and placed in an oil bath at 110°C. After 15.5 hours, the reaction was cooled to room temperature and purified by flash column chromatography using a gradient of CMA/chloroform as the eluent. Subsequent recrystallization from acetonitrile yielded 0.190 g of 2-ethoxymethyl-1-(3-methoxypropyl)-7-(pyrazol-1-yl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine as a white solid, mp 159.0-160.0 °C.

5 2-Ethoxymethyl-7-(imidazol-1-yl)-1-(3-methoxypropyl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine

The general method described in Example 452 was followed with imidazole replacing pyrazole as a reactant. After cooling to room temperature, the reaction mixture was poured into water and diluted with dichloromethane. The mixture was stirred for 10 minutes, followed by separation of the layers. The aqueous fraction was extracted with dichloromethane and the combined organic fractions were concentrated. The residue was initially purified by HPFC eluting with a linear gradient of 1-30% CMA in chloroform. A final recrystallization from acetonitrile provided 0.070 g of 2-ethoxymethyl-7-(imidazol-1-yl)-1-(3-methoxypropyl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine as an off-white solid, mp 167.5-169.0 °C.

Part A

A solution of 7-bromo-4-chloro-3-nitroquinoline (143.8 g, 0.5 mol) in 800 mL warm DMF was added to a stirred solution of ethylenediamine in 200 mL DMF at room temperature; the reaction was stirred at room temperature overnight. The reaction was quenched with 2 L water and stirred for an additional hour. Additional water was added, and the mixture was stirred overnight. A precipitate formed and was isolated by filtration and air-dried overnight on the filter funnel to provide  $N^1$ -(7-bromo-3-nitroquinolin-4-yl)ethane-1,2-diamine as a yellow solid.

20 Part B

To a stirred solution of  $N^1$ -(7-bromo-3-nitroquinolin-4-yl)ethane-1,2-diamine (50 g, 0.167 mol) and triethylamine (2 equivalents) in 1500 mL dichloromethane, was slowly added methanesulfonic anhydride (1.2 equivalents), and the reaction was stirred overnight at room temperature. Water (1 L) was added, and the mixture was stirred vigorously for one hour. The organic layer was separated and concentrated under reduced pressure to provide N-[2-(7-bromo-3-nitroquinolin-4-ylamino)ethyl]methanesulfonamide. Part C

An 8 L stainless steel Parr vessel was charged with N-[2-(7-bromo-3-nitroquinolin-4-ylamino)ethyl]methanesulfonamide (61 g), 5% Pt/C catalyst (6.0 g) and acetonitrile (3 L). The vessel was evacuated, filled with hydrogen (45 psi,  $3.1 \times 10^5$  Pa), and shaken at ambient temperature overnight. The reaction mixture was filtered through CELITE filter agent and concentrated under reduced pressure to provide N-[2-(3-amino-7-bromoquinolin-4-ylamino)ethyl]methanesulfonamide.

To a stirred solution of *N*-[2-(3-amino-7-bromoquinolin-4-ylamino)ethyl]methanesulfonamide (46.4 g, 0.129 mol) in 1000 mL pyridine was slowly added valeryl chloride (1.1 equivalents). After 1.5 hours the mixture was yellow and turbid. The reaction mixture was then heated at reflux for 12 hours, allowed to cool to ambient temperature and concentrated under reduced pressure. The residue was mostly dissolved in 10% HCl to adjust to pH 1. The resulting suspension was adjusted to pH 12 with the addition of 50% aqueous sodium hydroxide and stirred overnight. A precipitate formed and was isolated by filtration and air-dried to provide 45 g of *N*-[2-(7-bromo-2-butyl-1*H*-imidazo[4,5-c]quinolin-1-yl)ethyl]methanesulfonamide as a pale gray/green solid.

## 20 Part E

3-Chloroperoxybenzoic acid (1.0 equivalent of 50% pure material) was added to a solution of N-[2-(7-bromo-2-butyl-1H-imidazo[4,5-c]quinolin-1-yl)ethyl]methanesulfonamide (44 g, 103.4 mmol) in 1000 mL dichloromethane. After 2 hours, concentrated ammonium hydroxide solution (600 mL) was added. The reaction was stirred for 15 minutes before p-toluenesulfonyl chloride (1.1 equivalents) was slowly added in small portions. The reaction was stirred overnight at room temperature and then water and potassium carbonate were added with vigorous stirring. A precipitate formed and was isolated by filtration to provide N-[2-(4-amino-7-bromo-2-butyl-1H-imidazo[4,5-c]quinolin-1-yl)-ethyl]methanesulfonamide.

Part F

N-[2-(4-Amino-7-bromo-2-butyl-1H-imidazo[4,5-c]quinolin-1-yl)ethyl]methanesulfonamide was coupled with potassium vinyltrifluoroborate according to the procedure described in Part D of Examples 440-455 and recrystallized from acetonitrile to provide N-[2-(4-amino-2-butyl-7-vinyl-1H-imidazo[4,5-c]quinolin-1-yl)ethyl]methanesulfonamide as an off-white solid.

Part A

A mixture of  $N^1$ -(7-bromo-3-nitroquinolin-4-yl)ethane-1,2-diamine (40 g, 0.129 mol), triethylamine (3.0 equivalents) and 1L dichloromethane was stirred vigorously as isopropyl isocyante (1.1 equivalents) was added dropwise. As the reaction progressed it became more homogeneous, and then a yellow precipitate formed. After 4 hours the volume of dichloromethane was reduced under reduced pressure. The yellow solid was isolated by filtration and air-dried overnight to provide 43 g 1-(2-methylethyl)-3-[2-(3-nitroquinolin-4-ylamino)ethyl]urea.

Hydrogen chloride (100 mL of a 4 M solution in 1,4-dioxane) was added to tert-butyl [4-(4-amino-7-bromo-2-ethoxymethyl-1H-imidazo[4,5-c]quinolin-1-yl)butyl]carbamate (10.0 g, 20.3 mmol), and the reaction was stirred for one hour. The reaction was adjusted to pH 11 with the addition of sodium hydroxide pellets in a small amount of water. Chloroform (300 mL) was added followed by saturated aqueous sodium bicarbonate (50 mL). The organic layer was separated, dried over sodium sulfate, filtered, concentrated under reduced pressure, and dried overnight in a drying oven to provide 5.60 g of 1-(4-aminobutyl)-7-bromo-2-ethoxymethyl-1H-imidazo[4,5-c]quinolin-4-amine as a light yellow solid.

Part B

Methanesulfonyl chloride (0.44 mL, 5.7 mmol) was added to a suspension of 1-(4-aminobutyl)-7-bromo-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-4-amine (2.04 g, 5.2 mmol) and triethylamine (0.94 mL, 6.8 mmol) in chloroform (100 mL), and the reaction was stirred for four hours. Water was added; a precipitate formed. The aqueous layer was adjusted to pH 10 with the addition of 50% aqueous sodium hydroxide. The precipitate was isolated by filtration, washed with cold chloroform, and dried overnight on the filter funnel. Material from another run was added, and entire procedure was repeated to eliminate unreacted starting material. *N*-{4-[4-Amino-7-bromo-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]butyl}methanesulfonamide (2.95 g) was obtained as a white solid.

N-{4-[4-Amino-7-bromo-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]butyl}methanesulfonamide was coupled with the appropriate boronic acid or boronic acid ester according to the procedure described in Examples 20-65. The products were purified by prep HPLC according to the methods described above. butoxycarbonylaminomethyl)phenylboronic acid (2.0 g, 8.0 mmol) were coupled according to the procedure described in Part J of Example 1. Palladium (II) acetate was added as a 5 mg/mL solution in toluene. The reaction was heated for four hours, and the work-up procedure described in Examples 125-135 was followed.

10 The crude product was purified by HPFC (eluting with chloroform:CMA in a gradient from 100:0 to 80:20) to provide 2.94 g of *tert*-butyl {3-[4-amino-2-

Hydrogen chloride (30 mL of a 3 M solution in ethanol) was added to the material from Part A, and the reaction was heated at reflux for 30 minutes. A precipitate formed. Diethyl ether was added, and the precipitate was isolated by filtration, washed with diethyl ether, and air-dried to provide an off-white solid. The solid was partitioned between 2 M aqueous sodium carbonate, brine, and chloroform. The aqueous layer was extracted with chloroform. The combined organic fractions were dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by HPFC (eluting with chloroform:CMA in a gradient from 100:0 to 50:50). The resulting white solid was recrystallized from acetonitrile, isolated by filtration, washed with cold acetonitrile, and air-dried to provide 1.7 g of 1-[4-amino-7-(3-aminomethylphenyl)-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]-2-methylpropan-2-ol as a white solid.

Part C

A reagent from the table below, (0.11 mmol, 1.1 equivalents) was added to a test tube containing a solution of 1-[4-amino-7-(3-aminomethylphenyl)-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]-2-methylpropan-2-ol (40 mg, 0.097 mmol) and *N,N*-diisopropylethylamine (0.022 mL, 0.12 mmol, 1.25 equivalents) in chloroform (2 mL). The test tube was capped and placed on a shaker at ambient temperature overnight. The solvent was removed by vacuum centrifugation. The products were purified by prep HPLC according to the methods described above. #### CYTOKINE INDUCTION IN HUMAN CELLS

Many compounds of the invention have been found to modulate cytokine biosynthesis by inducing the production of interferon α and/or tumor necrosis factor α when tested using the method described below. Particular examples include but are not limited to the compounds of Examples 1-10, 12, 16, 18-21, 24-31, 43, 44, 51, 54, 55, 63, 66-101, 103-117, 119, 121-203, 205-390, 392-400, 403-407, 409-412, 414-418, 420, 425, 426, 428, 430-440, 442-446, 464-466, 468, 472-474, 476, 493, 494, 508-663, 807-830, 832-837, 839-841, 843, 844, 847-849, 852, 856, 858, 860-916, and 922-955.

An in vitro human blood cell system is used to assess cytokine induction. Activity is based on the measurement of interferon and tumor necrosis factor (α) (IFN and TNF, respectively) secreted into culture media as described by Testerman et. al. in "Cytokine Induction by the Immunomodulators Imiquimod and S-27609", *Journal of Leukocyte Biology*, 58, 365-372 (September, 1995).

Blood Cell Preparation for Culture

5

10

15

Whole blood from healthy human donors is collected by venipuncture into EDTA vacutainer tubes. Peripheral blood mononuclear cells (PBMC) are separated from whole blood by density gradient centrifugation using HISTOPAQUE-1077. Blood is diluted 1:1 with Dulbecco's Phosphate Buffered Saline (DPBS) or Hank's Balanced Salts Solution (HBSS). The PBMC layer is collected and washed twice with DPBS or HBSS and resuspended at 4 x 10<sup>6</sup> cells/mL in RPMI complete. The PBMC suspension is added to 48 well flat bottom sterile tissue culture plates (Costar, Cambridge, MA or Becton Dickinson Labware, Lincoln Park, NJ) containing an equal volume of RPMI complete media containing test compound.

10

15

20

5

### Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. The compounds are generally tested at concentrations ranging from 30-0.014  $\mu$ M.

## Incubation

The solution of test compound is added at 60  $\mu$ M to the first well containing RPMI complete and serial 3 fold dilutions are made in the wells. The PBMC suspension is then added to the wells in an equal volume, bringing the test compound concentrations to the desired range (30-0.014  $\mu$ M). The final concentration of PBMC suspension is 2 x 10<sup>6</sup> cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37°C in a 5% carbon dioxide atmosphere.

25

30

# Separation

Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 x g) at 4°C. The cell-free culture supernatant is removed with a sterile polypropylene pipet and transferred to sterile polypropylene tubes. Samples are maintained at -30 to -70°C until analysis. The samples are analyzed for

interferon (α) by ELISA and for tumor necrosis factor (α) by ELISA or IGEN Assay.

Interferon (a) and Tumor Necrosis Factor (a) Analysis by ELISA

Interferon (a) concentration is determined by ELISA using a Human Multi-Species kit from PBL Biomedical Laboratories, New Brunswick, NJ. Results are expressed in pg/mL.

Tumor necrosis factor (a) (TNF) concentration is determined using ELISA kits available from Biosource International, Camarillo, CA. Alternately, the TNF concentration can be determined by ORIGEN M-Series Immunoassay and read on an IGEN M-8 analyzer from IGEN International, Gaithersburg, MD. The immunoassay uses a human TNF capture and detection antibody pair from Biosource International, Camarillo, CA. Results are expressed in pg/mL.

#### TNF-a INHIBITION IN MOUSE CELLS

Certain compounds of the invention have been found to modulate cytokine biosynthesis by inhibiting production of tumor necrosis factor  $\alpha$  (TNF- $\alpha$ ) when tested using the method described below. Particular examples include but are not limited to the compounds of Examples 14, 15, and 481.

The mouse macrophage cell line Raw 264.7 is used to assess the ability of compounds to inhibit tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ) production upon stimulation by lipopolysaccharide (LPS).

Blood Cell Preparation for Culture

Raw cells (ATCC) are harvested by gentle scraping and then counted. The cell suspension is brought to 3 x  $10^5$  cells/mL in RPMI with 10 % fetal bovine serum (FBS). Cell suspension (100  $\mu$ L) is added to 96-well flat bottom sterile tissues culture plates (Becton Dickinson Labware, Lincoln Park, NJ). The final concentration of cells is 3 x  $10^4$  cells/well. The plates are incubated for 3 hours.

Prior to the addition of test compound the medium is replaced with colorless RPMI medium with 3 % FBS.

#### Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. Compounds are tested at 5μM. LPS (Lipopolysaccaride from Salmonella typhimurium, Sigma-Aldrich) is diluted with colorless RPMI to the EC<sub>70</sub>

concentration as measured by a dose response assay.

10

15

20

#### Incubation

A solution of test compound (1 $\mu$ l) is added to each well. The plates are mixed on a microtiter plate shaker for 1 minute and then placed in an incubator. Twenty minutes later the solution of LPS (1  $\mu$ L, EC<sub>70</sub> concentration ~ 10 ng/ml) is added and the plates are mixed for 1 minute on a shaker. The plates are incubated for 18 to 24 hours at 37 °C in a 5 % carbon dioxide atmosphere.

## TNF-α Analysis

Following the incubation the supernatant is removed with a pipet. TNF- $\alpha$  concentration is determined by ELISA using a mouse TNF- $\alpha$  kit (from Biosource International, Camarillo, CA). Results are expressed in pg/mL. TNF- $\alpha$  expression upon LPS stimulation alone is considered a 100% response.

## Dose Response Assay:

#### 25 Blood Cell Preparation for Culture

Raw cells (ATCC) are harvested by gentle scraping and then counted. The cell suspension is brought to 4 x  $10^5$  cells/mL in RPMI with 10 % FBS. Cell suspension (250  $\mu$ L) is added to 48-well flat bottom sterile tissues culture plates (Costar, Cambridge, MA). The final concentration of cells is 1 x  $10^5$  cells/well. The

#### Incubation

A solution of test compound (200  $\mu$ l) is added to each well. The plates are mixed on a microtiter plate shaker for 1 minute and then placed in an incubator. Twenty minutes later the solution of LPS (200  $\mu$ L, EC<sub>70</sub> concentration ~ 10 ng/ml) is added and the plates are mixed for 1 minute on a shaker. The plates are incubated for 18 to 24 hours at 37 °C in a 5 % carbon dioxide atmosphere.

## TNF-α Analysis

Following the incubation the supernatant is removed with a pipet. TNF- $\alpha$  concentration is determined by ELISA using a mouse TNF- $\alpha$  kit (from Biosource International, Camarillo, CA). Results are expressed in pg/mL. TNF- $\alpha$  expression upon LPS stimulation alone is considered a 100% response.

### INTERNATIONAL SEARCH REPORT

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
2. X Claims Nos.: 1-7 because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  See FURTHER INFORMATION sheet PCT/ISA/210
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)
This International Searching Authority found multiple inventions in this international application, as follows:
As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this international Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
Remark on Protest  The additional search fees were accompanied by the applicant's protest.  No protest accompanied the payment of additional search fees.

### FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1-7

Present claims 1-7 relate to an extremely large number of possible compounds. Due to the expression "non-interfering substituents" the claims contain so many options that a lack of clarity (and conciseness) within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible. Consequently, the search has been carried out for those parts of the application which do appear to be clear (and concise), namely claims 8-136.

The applicant's attention is drawn to the fact that claims relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure. If the application proceeds into the regional phase before the EPO, the applicant is reminded that a search may be carried out during examination before the EPO (see EPO Guideline C-VI, 8.5), should the problems which led to the Article 17(2) declaration be overcome.
